# Iris Sibirica Not Quite White

Genus	Iris
Species	Sibirica
Flower form	Single
Colour	Off-White
Plant height	45 cm
Flower dia	10 cm
Flowering	May

**SAMPLE; 3 LITER CONTAINER GROWN WITHIN 65 DAYS FROM BARE ROOT.**

**16 May inside**

**19 May outside**

**19 May outside**

## USP'S

- Very rich flowering cultivar
- Each flower bud contains 2 flowers. When the first flower is finished the second comes right after. BONUS!!
- Very easy growing
- Attractive to bees and butterflies
- Winter hardy to -20C
- Compact and uniform
- Also attractive after flowering with upright grassy leaves
- Can also be planted on the edge of a water pond

## **CONTAINER (POT SIZE 19 CM, 3 LITRE) GROWTH DESCRIPTION**

### **IRIS SIBIRICA**

**Storage:** The Iris's are delivered in a dormant stage, so without leafs. The roots have a length of 15 cm, if for potting the root length is a problem it can be reduced to 10 cm, do realize however, that the root provide energy which is useful at the start of the cultivation. As long as the Irises are at rest, planting can be delayed. If during or after transport the temperature increases and the dormant stage is broken it is wisely to plant as quickly as possible. The faster the Irises are planted, the less delay they encounter with their re-growth. If you receive the plants but won't plant them directly, then the roots prefer cool (2-3 ° C) and dark place and ensure that the roots do not dry out.

**The planting:** The Iris Sibirica prefers a slightly acidic soil (pH 5.5 to 6.9). Plant the Iris with its top side of the head equal to the ground. Prepare a clean growing medium (potting soil), without weeds and dead leaves, which prevents diseases and pests. Place the pots, preferably on the container field, about 25 per m<sup>2</sup>. New roots develop on the old roots, new roots will develop later. Iris Sibirica remain longer, if they are planted deep enough. Give plenty of water immediately after planting, make sure they do not dry out. The Iris Sibirica doesn't need to be covered up, it is hardy as long as they do not dehydrate.

**Plant Care:** The first season the Iris will give several flowers, but as they grow older, they will enrich enormous. After blooming the flower stems can be removed, but not necessary as the seed pods are also very decorative. Remove the withered leaves of the Iris in the spring.

**Fertilization:** Iris Sibirica doesn't need to be overly fed by fertilizers, but by rapid growth it requires a good ratio N/K. A gift of a compound fertilizer (12N-11P-18K) in spring and immediately after flowering, promotes growth.
